## **ABSTRACT**

A non-rotating electrodeless high-intensity discharge lamp circularly polarized microwaves using is herein disclosed. In an embodiment, the lamp system has a first rectangular waveguide (1) to propagate linearly polarized microwaves generated from a microwave source; an input circular waveguide linearly connected to the first rectangular (2) waveguide; a second rectangular waveguide (3) closed at an end thereof, and perpendicularly connected to a circumferential surface of the input circular waveguide; elliptical an wavequide (4)linearly connected to the input circular waveguide such that the major axis of the elliptical waveguide is rotated to a predetermined angle relative to a horizontal surface (or the wider surface) of the input rectangular waveguide; a second circular waveguide (6) linearly connected to the elliptical waveguide; and a discharge lamp (5) housed in a mesh cover(7), and supported by the second circular waveguide while being held on a reflecting mirror (9). The lamp system thus effectively converts the linearly polarized microwaves into the circularly polarized microwaves due to a geometrical structure thereof caused by the angle at which the major axis the elliptical waveguide is rotated relative to horizontal surface of the input waveguide, thereby allowing the circularly polarized microwaves to reach the discharge lamp.
